PROFILE

Computer Science undergraduate (Class of 2027) specializing in Data Engineering with hands-on experience building real-time streaming pipelines, cloud-based data lakes, and automated analytics workflows. Strong in Python, SQL, Apache Kafka, Apache Airflow, AWS S3, and MySQL, with a track record of shipping production-style projects end-to-end. Seeking a Summer 2026 Data Engineering internship to contribute to real-world data infrastructure and learn from senior engineers.

CORE SKILLS

Languages	Python, SQL, Java, C++, Bash	Data Engineering	ETL Pipelines, Data Warehousing, Data Lakes, Aggregation, Modeling
Streaming & Orchestration	Apache Kafka, Apache Airflow, Docker Compose	Databases	MySQL, SQL Joins, Window Functions, Query Optimization
Cloud & Analytics	AWS S3, Amazon Athena	Tools	Git, Docker, VS Code

EXPERIENCE

Data Science & Analytics Intern Feb 2026 – Mar 2026
DevelopersHub Corporation (Remote)

- Built and evaluated ML classification models on real-world datasets, owning the pipeline from preprocessing to model export with Pickle.
- Performed feature engineering and data preprocessing to improve input quality and downstream model performance.
- Collaborated inside an analytics workflow, gaining hands-on experience with production-style data processing and reporting.

PROJECTS

Real-Time Cyber Threat Detection Pipeline Python · Kafka · Airflow · MySQL · AWS S3 · Athena · Flask · Docker

- Architected a streaming pipeline using Kafka producers/consumers to ingest and process simulated web-server logs containing malicious traffic.
- Implemented a rule-based detection engine flagging SQL injection, XSS, brute-force, and directory-traversal attacks with live alerts.
- Stored structured logs in MySQL and raw JSON in S3 (partitioned) for cost-efficient querying via Amazon Athena; built a Flask dashboard with live alerts, attack statistics, and time-series visualizations.
- Automated hourly aggregation and monitoring with Airflow DAGs and Docker Compose for full reproducibility.

🐙 GitHub

Pakistan Flood Risk Monitoring System Python · Apache Airflow · MySQL · Streamlit · OpenWeatherMap · FAO API

- Built an end-to-end automated ETL pipeline with Airflow, ingesting real-time weather data from OpenWeatherMap and historical flood records from FAO Pakistan.
- Designed a multi-factor risk scoring algorithm (temperature, humidity, rainfall) with automated email alerts for high-risk cities.
- Delivered a Streamlit dashboard with filters, charts, and CSV export for operational flood-risk decision-making.

🐙 GitHub

Customer Transactions Data Warehouse SQL · MySQL · Window Functions · Star Schema

- Designed a star-schema data warehouse for customer transactions, leveraging SQL window functions (RANK, LAG, running totals) for analytics.
- Optimized reporting queries with indexing and aggregations, demonstrating data modeling and query performance tuning.

🐙 GitHub

Daily Sales Aggregation & Reporting Pipeline Python · SQL · Automation

- Automated end-of-day sales reporting using Python and SQL transformations, replacing manual reporting and improving data consistency.
- Implemented scheduled job orchestration to ensure timely, accurate delivery of daily KPIs to stakeholders.
